TITLE: The effect of furazolidone on the toxigenicity of pyrogenic staphylococcus

SOURCE: Zhurnal mikrobiologii, epidemiologii, i imunobiologii, no. 7, 1966, 140-141

TOPIC TAGS: staphylococcus, furazolidone, toxicology, infective disease, human ailment

ABSTRACT:

The effect of furazolidone on the toxic properties of antibiotic-resistant staphylococcus was investigated by determining the output of hemolytic, necrotic, and lethal toxins in staphylococcus under experimental and control conditions. Furazolidone was used in minimum (bactericidal for a 50 million/1 ml concentration of microbial cells) and maximum (10 µg/1 ml) doses. Following a three-hr incubation of staphylococcus in nutrient media with maximum and minimum furazolidone doses, the cultures were centri-

fuged three times and then grown for ten days in a 25% CO<sub>2</sub> atmosphere on Martin's broth, after which the culture fluid was separated from the microbe cells by centrifugation. Hemolysin content was determined by two-hr incubation of a mixture of 5% suspension of 0.1 ml washed rabbit erythrocytes and 1 ml culture fluid diluted to 1:10—1:300. Hemo-toxin content was then judged by hemolysis. In the controls (without furazolidone) hemolytic activity was high and the hemolytic titer correlated to a 1:100—1:300 dilution of culture fluid, compared to the experimental group, where hemolysis was absent or the hemolytic titer was significantly lower than in the controls. Necrotoxin content was determined in skin tests on rabbits, injected intracutaneously with 0.1 ml culture fluid and studied after 48—72 hr. The maximum dose, even undiluted, produced no reactions in rabbits, and the minimum dose reduced the necrotic properties of staphylococcus toxins. Lethal dose was judged by mortality among mice injected intraperitoneally with 0.5 ml culture fluid: in the experimental group where no deaths occurred even the minimum dose destroyed the capacity of staphylococci to produce lethal toxins; all the controls died. It was concluded that furazolidone must act favorably

PURPOSE: This book is intended for technical personnel in foundry shops.

CONTENTS: The book contains drawings of an automatic installation for the

production of carbon dioxide. A brief description is also given of basic

methods of CO<sub>2</sub> production for general industrial uses and for the food industry.

The installation was exhibited at the All-Union Industrial Exposition in 1958.

No publications are mentioned. There are no references.

TABLE OF CONTENTS: None given. The book is divided as follows:

Foreword

Modern Methods of CO<sub>2</sub> Production

Principle of Operation of the Automatic Installation

for the Production of CO<sub>2</sub>

Calculations for the Installation

Automatic Control Scheme

Basic Assemblies of the Automatic Installation

PERIODICAL: Izv estsiya Akademii nauk SSSR. Otdeleniye khimicheskikh nauk 1959, Nr 12, p 2261 (USSR)

ABSTRACT: Reaction of 1 mole of copper salt of acetylacetone with 2 moles of tetracyanoethylene under vacuum, at 160-300°, proceeded with formation of a complex polymer and separation of acetylacetone. The polymer (infusible black substance) was insoluble in organic solvents, in bases and diluted acids. IR absorption spectrum showed no intense absorption bands in the 700-3,000 cm<sup>-1</sup> range, with the exception of a 2,314 cm<sup>-1</sup> band corresponding to the CH-group. The following structure of the chelate was suggested:

Card 1/3

Letters to the Editor

367/62-59-12-43/43

Elemental analysis showed the presence of acetylacetone groups. Electron paramagnetic resonance spectrum showed broad intense lines with 500-700 oersted separation between peaks. An equimolar mixture of copper salt of acetylacetone, tetracyanoethylene, and fluoronitrile gave a copolymeric chelate with a presumably bandlike structure.

TITLE: Some electrophysical properties of polymer complexes of tetraethylene cyanide with metals

PERIODICAL: Doklady Akademii nauk SSSR, v. 136, no. 5, 1961, 1127-1129

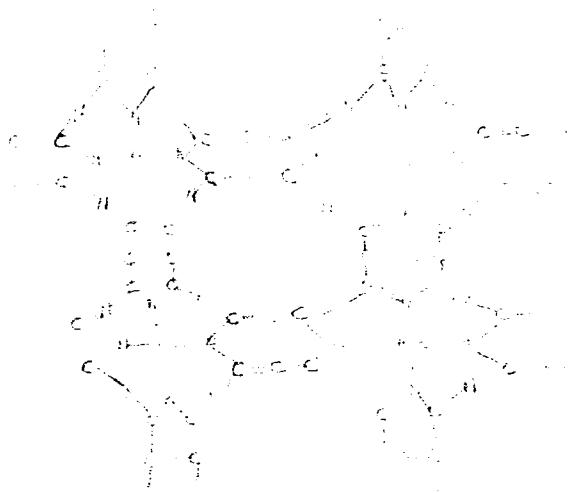

TEXT: The authors deal with the chelate compounds between tetraethylene cyanide and metals. The infusibility and insolubility of these compounds led to the proposal that coatings and plastics be manufactured from them (Ref. 3). The electrophysical properties of polymeric chelate films chemically bonded to metals, which were obtained by treatment of copper, iron, and nickel sheets with tetraethylene-cyanide vapor, were studied in this paper. The degreased and, in some cases, also electropolished or etched metal foils were exposed to tetraethylene-cyanide vapor at  $10^{-5}$  mm Hg and 150 to 400°C. A film firmly sticking to the metal developed, the thickness of which was calculated from the specific gravity of the

Some electrophysical properties ...

polymer and from the weight of the film as being  $5 \cdot 10^{-6} - 3 \cdot 10^{-5}$  cm.  
(Owing to the poor combustibility of the chelate film, microanalysis produced too low carbon values). The infrared spectra of the copper complex taken by Yu. Sh. Moshkovskiy and N. D. Kostrova, showed the complete absence of maxima in the range  $800 - 2300 \text{ cm}^{-1}$ . A "parquet" structure of the polymer according to the structural formula

Card 2/4

20361

S/020/31/136/705/722/032  
D101/B206

Some electrophysical properties ...

is concluded therefrom. The electrophysical properties of the films were checked by means of alternating current of 200 cps - 0.2 Mc/sec. The metal covered by the film was immersed in mercury so that the film formed the dielectric of a capacitor, the plates of which consisted of the metal and of mercury. Measurements were made at  $10^{-5}$  mm Hg because the presence of air influenced the results. This effect needs further research. The specific conductivity  $\sigma$ , the film capacitance and its temperature dependence, duration of heating, and the method of metal-surface treatment were determined. The following data are given for films of iron obtained after 3 hr heating at  $250^{\circ}\text{C}$  in tetraethylene-cyanide vapor: film thickness

$3 \cdot 10^{-6}$  cm;  $\sigma = 3 \cdot 10^{-9} \text{ ohm}^{-1} \cdot \text{cm}^{-1}$ , effective dielectric constant  $\epsilon$  (at 3000 cps) = 7. After further 3 hr of heating,  $\sigma$  increased to

$3 \cdot 10^{-8} \text{ ohm}^{-1} \cdot \text{cm}^{-1}$ , and to 36. Increase of temperature from  $250$  to  $450^{\circ}\text{C}$ . and heating for 10 hr produced the following values:

$\sigma = 5 \cdot 10^{-8} - 5 \cdot 10^{-6} \text{ ohm}^{-1} \cdot \text{cm}^{-1}$ ,  $\sigma = 70$ . The sign of the emf indicates that the film possesses p-type conductivity.  $\log \sigma = f(10^3/T)$  is represented in Fig. 2. Measurements between  $-40$  and  $+220^{\circ}\text{C}$  yielded two linear sections.

Card 3/4

20361

S/020/61/134/005/027032

B101/B206

Some electrophysical properties ...

The first lies between -40 and +30°C and corresponds to an activation energy of from 0.0 to 0.12 ev, while the second (30 to 250°C) corresponds to an activation energy of from 0.21 to 0.28 ev. The function represented is similar to that obtained for semiconductors with impurity conductivity. R and C as functions of the logarithm of the frequency between 400 cps and 0.2 Mc/sec were also measured. Results are shown in Fig. 3. It is noted that R and the film capacitance decrease with increasing voltage when a constant voltage is applied. When a direct current is conducted through an alcoholic solution of copper sulfate, metallic copper firmly adhering to the film is deposited on the polymer film formed on iron. The high values indicate that the polarization of conductive macromolecules could be in question. The authors are preparing a study on the complex dielectric constant at higher frequencies. There are 4 figures and 3 Soviet-bloc references.

TITLE: Polymers with conjugate bonds and heteroatoms in the con-  
jugate chains. XXI. Polymeric complexes of tetraethylene  
cyanide

PERIODICAL: Vysokomolekulyarnyye soyedineniya, v. 4, no. 6, 1962, 860-868

TEXT: The preparation of polymers from tetraethylene cyanide and metals  
or metal salts was studied because: (1) tetraethylene cyanide has a  
planar structure, which permits conjugation via nitrile groups; (2) it  
shows four nitrile groups on two carbon atoms, and may form cyclic  
structures with and without metal atoms; (3) polymers obtained from it  
and the metals have so far been the only "inorganic" macromolecular  
compounds with directly bonded carbon, nitrogen and metals; and (4)  
because of the high vapor tension and heat stability of the monomer  
polymer complexes can be formed directly on the metal surface (Cu, Fe,  
Ni, Al etc). Black films which were insoluble in organic, alkaline, and  
X

Card 1/4

S/190/62/004/006/012/026  
B110/B138

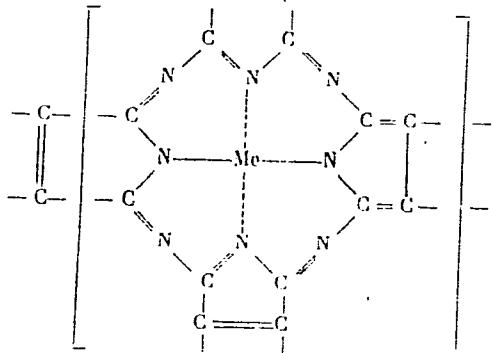

Polymers with conjugate bonds...

acidic substances were obtained here after 5 - 20 hr at 150 - 450°C. The black, infusible, hydroscopic polymers obtained from tetraethylene cyanide and copper acetylacetone (2:1) were insoluble in common organic substances, variously soluble in dimethyl formamide, pyridine, triethanolamine and concentrated H<sub>2</sub>SO<sub>4</sub>. The IR spectra of the films obtained from tetraethylene cyanide and copper showed a background at 700 - 1800 cm<sup>-1</sup> which is typical for built-up or planar polymers with conjugate bonds. Polymers from copper acetylacetone showed a wide asymmetric absorption band at 1700 - 1400cm<sup>-1</sup>. For all polymers the absorption maximum lies at ~2210 cm<sup>-1</sup>, which corresponded to the C≡N bond. The intensive background confirmed the strongly branched system of the conjugate bonds. The degree of order depends on conditions of synthesis. Polymers obtained from copper acetylacetone showed abnormal  $\eta/c$  dependence on c, similar to polyphenylenes and polyazophenylenes. The presence of neighboring C≡N groups points to the formation of energetically favorable, flat azophphin structures with or without chelate-like bonded metals:

Card 2/4

Polymers with conjugate bonds...

S/190/62/004/006/012/026  
B110/B138

Polymers obtained from metals had much higher heat stability than those obtained from copper acetylacetone, since the acetylacetone groups bonded to a metal of different valences initiate chain decomposition into peroxide radicals. The magnetic susceptibility depends on the flux density and temperature, and is higher ( $\chi = 1.03 \cdot 10^{-5}$  CGSM) (200°C, 3500  
Card 3/4

Polymers with conjugate bonds...

S/190/62/004/006/012/026  
B110/B138

oersted) for a polymer obtained from acetylacetone in absence of the solvent than for one obtained in the presence of cyclohexanone. The dependence of  $\log \sigma$  on  $1/T$  is linear for all polymers. The conductivities are  $10^{-5}$  to  $10^{-12} \text{ ohm}^{-1} \cdot \text{cm}^{-1}$ , the activation energy  $E = 10 - 15 \text{ kcal/mole}$ . There are 5 figures and 4 tables.

TITLE: Formation of a tetracyanoethylene chelate polymer

SOURCE: AN SSSR. Izv. Seriya khimicheskaya, no. 6, 1964, 1132

TOPIC TAGS: tetracyanoethylene, organic semiconductor, semiconducting polymer, chelate polymer, copper tetraacetylenide

ABSTRACT: Copper tetraacetylenide (I) has been prepared, identified, and its semiconducting properties studied. Salt I was obtained in acetonitrile and with lower yield in nitrobenzene. Identification was made by elemental analysis and UV and IR spectroscopy. At below 100°C, electrical conductivity ( $\delta$ ) in vacuum was described by

$$\delta = 10^{-0.6} \exp(-5670/RT), \delta_{300k} = 10^{-4.7} \text{ ohm}^{-1} \text{ cm}^{-1}.$$

At higher temperatures  $\delta$  drops irreversibly and after heating to 150°C becomes  $\delta = 10^{0.8} \exp(11900/RT)$ ,  $\delta_{300k} = 10^{-7.8} \text{ ohm}^{-1} \text{ cm}^{-1}$ .

Card 1/2

ACCESSION NR: AP4041172

If I is heated in the presence of tetracyanoethylene a new compound (II) is formed which unlike I is insoluble in acetonitrile and tetrahydrofuran. Compound II is highly soluble in H<sub>2</sub>SO<sub>4</sub> and can be precipitated from it with water. IR spectroscopy suggests that II is a chelate polymer. The work was carried out at the Institute of Chemical Physics of the Academy of Sciences USSR.

the reaction of tetracyanoethylene with powdered metals

SOURCE: Vysokomolekulyarnyye soyedineniya, v. 7, no. 1, 1965, 88-93

TOPIC TAGS: coordination polymer, polytetracyanoethylene, tetracyano-  
ethylene

ABSTRACT: Communication 58 of the series "Polymers with a Conjugated System" reports the preparation of copper, iron, and magnesium tetracyanoethylene (TCE) coordination polymers and metal-free polytetra-cyanoethylene. They were made by reacting TCE with copper, iron, magnesium, or bronze in a 2/1 molar ratio in nitrobenzene in a stream of argon at 210C for 10 hr. All the coordination polymers obtained were infusible black powders, insoluble in the common organic solvents but soluble in concd H<sub>2</sub>SO<sub>4</sub>. The copper-containing polymer was stable in H<sub>2</sub>SO<sub>4</sub>, but the magnesium-containing polymer lost the metal to form

Card 1/2

Title : Note 21786  
Subject : Forest Shelters for Rotating Field  
Societies.

Origin, Publ.: Period. Agric. & Soil Sci., Washington, 1973,  
No. 1, 21-23

Abstract : Walking and experiment station experience shows that on the slope areas the grain yields from sheltered fields are higher by 15-6 cwt/ha than on the open fields. The greatest yield increase is found in the direct vicinity of the forest strip up to a distance of 50 m from it. Therefore, narrow strips (3-6 rows) should be placed not far from each other. Wider strips (10-12 rows) should be used where danger from wind erosion.

TITLE: The transparent hexagonal ferrimagnet RbNiF<sub>3</sub>

SOURCE: Fizika tverdogo tela, v. 8, no. 10, 1966, 2965-2969

TOPIC TAGS: rubidium compound, magnetic property, magnetic susceptibility, magnetic anisotropy, Curie point, magnetic structure

ABSTRACT: The purpose of the investigation was to study the magnetic properties of single-crystal RbNiF<sub>3</sub>, both above and below the magnetic-transition temperature, in view of the fact that they were hitherto investigated only in the paramagnetic region in single-crystal form. Transparent RbNiF<sub>3</sub> crystals with low dielectric losses can be of interest for modulation of light beams in microwave devices at low temperatures. The single crystals were obtained by exchange decomposition at high temperatures. The magnetic properties were investigated with a magnetic balance by the Faraday method in fields from 2 - 14 kOe. The apparatus was described earlier (FIT v. 6, 3668, 1964) and was modified to accommodate anisotropic crystals. The reciprocal magnetic susceptibility was measured as a function of the temperature and the magnetic-moment components were determined as functions of the field intensity at different temperatures. The results confirm that RbNiF<sub>3</sub> is a ferrimagnet of the ferroplan type with a Curie

Card 1/2

ACC NR: AP6033557

temperature of 145K. The magnetic structure and the magnetic anisotropy of RbNi<sub>3</sub> exhibit a complicated variation which can be interpreted from the point of view of the assumption that as the temperature is increased the magnetic structure changes from one with an easy-magnetization plan to one having a cone of easy-magnetization directions. Orig. art. has: 6 figures and 5 formulas.

form characteristic of ferrimagnets. The magnetic ordering sets in at 145K. Plots were obtained of the magnetic moment at 77K against the field intensity and against the temperature in the direction along the hexagonal axis and perpendicular to it. From these plots it is possible to estimate the field of negative uniaxial anisotropy at 77K ( $\sim 25$  koe) and the sum of the magnetic anisotropy constants ( $K_1 + K_2 \approx -0.4 \times 10^6$  erg/cm<sup>3</sup>). The results are interpreted from the point of view of the collinear model of ferrimagnetism. The value obtained on this basis for the specific magnetization is 18 G-cm<sup>3</sup>/deg. Although the obtained value of the saturation magnetization per formula unit at 0°K is found to be somewhat lower than the theoretical value ( $\sim 2/3$  Bohr magnetons), the difference is attributed to the high temperature of the experiment (more than half the Curie temperature). The results show that on approaching the Curie point the anisotropy constants decrease rapidly, and this gives rise to a spontaneous magnetic moment. It is concluded on the basis of all the data that RbNiF<sub>3</sub> is a transparent ferrimagnet of the ferroxyplan type. Orig. art. has: 2 figures.

TITLE: Technological process of casting crankshafts for the Д8-30 (DV-30) engine at the Vladimirovskiy traktornyy zavod (Vladimirov Tractor Plant)

PERIODICAL: Liteynoye prizvodstvo, no. 10, 1960, 16 - 17

TEXT: Based on the experience of the Khar'kov "Serp i molot" Plant, the Vladimirov Tractor Plant started the casting of crankshafts for the DV-30 engine. The authors enumerate the deficiencies occurring during the casting of the crankshaft for the CMd-7 (SMD-7) engine at the "Serp i molot" Plant and point out that the elimination of black spots by increasing the machining tolerances is not expedient; therefore, it is necessary to prevent the origination of black spots which can be attained by the desulfurization of the cast iron, bringing the S-content down to 0.008 - 0.005%. This is possible if the cast iron is smelted in a basic electric furnace. Attempts were made to eliminate the technical difficulties connected with the

Technological process of casting crankshafts... A033/A133

production of magnesium-modified cast iron by using other modifiers, like cerium, tellurium, calcium, strontium, lithium, etc. Tests proved cerium and foundry alloys on the base of cerium to be the most suitable modifiers. In comparison with magnesium, cerium offers the following advantages: no metal ejection during modification; the assimilability of cerium amounts to not less than 30%; lower sensitivity of the cast iron to demodifiers; insignificant cast iron temperature drop during the modification process (between 20 and 40°C); uniform distribution of sulfur over the casting and absence of black spots on its surface. In order to maintain a constant chemical cast iron composition during the investigations basic cast iron of the following chemical composition (in %) was smelted in a 3-ton acid electric furnace: 3.5 - 3.8 C; 2.0 - 2.2 Si; 0.8 - 1.0 Mn; not more than 0.04 S. Then this cast iron was remelted in a 50-kg capacity acid induction furnace. The metal was heated to 1,480 - 1,450°C, the modifiers (composition: 5 - 7% Mg, 10% Fe, 40 - 50% Ce, the rest rare earths) amounting to 0.4 - 0.35% of the liquid metal weight was put on the ladle bottom. To remove cementite formations and increase the mechanical properties, the cast iron was subjected to additional modification by 0.3 - 0.4% Cu (Si) 75 ferrosilicium. After two minutes holding in the ladle the metal was poured into the crankshaft

SHERMAN, B.A.

Methods for Testing the Porosity of Tin Films. M. L. Zibol'farb and B. A. Sherman (Zavod. Lab., 1945, 11, 1110-1121; C. (U.S.), 1946, **40**, 7130). [In Russian]. The porosity of tin films was best determined by anodic treatment in solutions containing potassium ferricyanide (10 g/l), sodium sulphate (10 g/l), and sodium chloride. The duration of the electrolysis was 5 min and the initial c.d. 0.5-0.6 amp./dm<sup>2</sup>. A passive film was formed on the anode during the electrolysis and the c.d. decreased. The pores appeared as red spots. The test did not result in an appreciable destruction of the tin film. The change in weight of the sample did not exceed + 0.004 g. in samples weighing 3.5 g.

✓ Pilot-plant smelting of nickel-ore with enriched blast. L. K. Petrov, I. D. Reznik, V. I. Serpov, L. L. Chernyak, and B. P. Sherman. *Tsvetnye Metal.* 29, No. 8, 33-5 (1958).—The blast fed to an exptl. shaft furnace smelting Ni ores was enriched to 25.7% O<sub>2</sub>. The typical charge was ore, coke, and gypsum. The rate of coke charge necessary for operation was decreased from 25% to 22.4% by use of the enriched blast. In addn. it was possible to increase the smelting rate from 28 tons/sq. m. of hearth to 38 tons/sq. m. Ni content of the mat also increased during the period when O<sub>2</sub> was used. R. W. Guard.

TITLE: Shaft Smelting of Sintered Oxidized Nickel Ores With  
Hot Blast

PERIODICAL: Tsvetnye metally, 1959, Nr 7, pp 30-36 (USSR)

ABSTRACT: The use of hot blast in shaft smelting in non-ferrous metallurgy is comparatively recent. The authors describe production experiments made by the kombinat (combine) Yuzhuralnikel' together with Gintsvermet and Gipronikel'. Aside from the authors the following participated in the work. From Yuzhuralnikel': S. Ye. Lyumkis, M.M. Zolkina, A.G. Ushakov, V.T. Gritskova, U.D. Shaymukhambetov, N.V. Sukhin, I.S. Firago, V.I. Mannanikov; from Gintsvermet: A.S. Buntovnikov, M.S. Kruglyakova, Yu. N. Skvortsov, L.I. Yevdokimova; from Gipronikel': N.P. Malyk, Ye. M. Simonov, N.N. Sin'ko, A.N. Derevnin. The furnace used had a cross section in the tuyere zone of  $7.2 \text{ m}^2$  and a width of 2m; stack height was 8 m and the slit tuyeres dipped at  $15^\circ$ .

Shaft Smelting of Sintered Oxidized Nickel Ores With Hot Blast

Blast heating was provided by a specially designed oil-fired heater. Suitable instrumentation was provided. The experiments were conducted as during a previous investigation (Ref 4) on the same furnace; a parallel investigation of stack processes was carried out (Ref 5). Blast temperatures of 190, 300 and 400°C were used, the furnace working smoothly (Fig 1 shows the blast-pressure chart) and without difficulties. Compared with cold-blast operation on the same furnace a coke saving of 28.9% was obtained by blast heating to 300°C; allowing for the oil used in the blast heater the economy was 15.2% by weight, 11.5% if the difference in calorific value of oil and coke is taken into account. Fig 2 shows that top gas composition is best at 300°C. This temperature is also close to the optimum for fuel economy (Fig 3) and smelting and coke burning rates (Fig 4). The authors conclude that the tests have shown that blast heating should be introduced into practice. They recommend that oil- or gas-fired blast heaters should be designed, and that the development of methods for blast heating using the heat

TITLE: Introducing level-meters to nonferrous metallurgy  
plants

PERIODICAL: Referativnyy zhurnal, Avtomatika i radioelektronika,  
no. 12, 1961, 31, abstract 12A229 (Radioakt. izotopy i  
yadern. izlucheniya v nar. kh-ve SSSR. V. 3, M., Gos-  
toptekhizdat, 1961, 162-164)

TEXT: Described is a high sensitivity positional level-meter (L)  
type УРП-1013 (URP-1013) for signalling attainment of the degree of  
separation between two substances of different densities without  
direct contact with the system under investigation. The separation  
is determined by recording the change of intensity of  $\gamma$ -radiation  
passing through the mixture. The instrument consists of a power  
unit, four radiation sources and four radiation receivers. Various  
installation methods of L are described, depending on the proper-

AUTHORS: Lyubchenko, A.P., Sherman, D.G., and Kuz'minov, G.S.

TITLE: Effect of cerium content of iron on self-diffusion

TECHNICAL: Fizika metallov i metallovedeniye, v.15, no.1, 1963,  
158-160TEXT: The authors have already shown that Ce additions of up  
to 0.5% have no effect on the ratio of the intercrystalline ( $D_{Boun}$ )  
and transcrystalline ( $D_{Body}$ ) self-diffusion coefficients of Fe.Further investigations were carried out on pure Armco iron, vacuum  
induction melted, into which Ce was added, and the ratio  $K_{Fe}$ ,  
which equals

$$d(D_{Boun} \times D_{Body}^{-1/2})$$

was determined using the isotope  $Fe_{59}$ . It was found that Ce  
additions of up to 0.52% had little effect on the self-diffusion  
ratio, and that at elevated temperatures the individual values for  
inter- and trans-crystalline diffusion were not greatly changed.

Effect of cerium content of iron...

S/126/63/015/001/029/029  
E073/E151

Fluctuations of  $\pm 100\%$  in the value of  $K_{Fe}$  were obtained as Ce was increased from 0 to 0.52%, but the overall effect, discounting the fluctuations, appeared to be negligible. This is contrary to the findings of K.P. Bunin and Ya.M. Nalinochka that the effect of spheroidisers was to equalise the inter- and trans-crystalline mobilities of the Fe atoms. The experimental and published results show that the effect of Ce, Mg, etc. on the graphite in cast iron is not related to the kinetics of self-diffusion and it is probable that the surface active properties of the spheroidiser are responsible for spheroidisation. The electron orbits of additions appear to influence the shape of the graphite particles, as is seen by comparing the electron structures of spheroidising agents (Li, Na, Mg, K, Ca, Sr, Ba, Ce) with those of de-spheroidising agents (Ti, Cu, Sb, Pb, Bi). Inconsistencies in the behaviour of added elements on the structure of the graphite appears to be due to changes in electron configuration caused by interaction with impurities in the iron. Spheroidisation can also be achieved by additions which ensure the required electron configuration when absorbed on the graphite.

AUTHORS: Lyubchenko, A.P., Sherman, D.G. and Udovikov, V.I.  
TITLE: The effect of small magnesium additions on the self-diffusion of iron  
PERIODICAL: Fizika metallov i metallovedeniye, v. 15, no. 2, 1965, 295 - 297

TEXT: In continuation of earlier work (A.P. Lyubchenko et al - FMM, 1962, 14, 1; 1962, 14, 6), the present authors studied the nature of self-diffusion of iron modified with additions of magnesium in quantities (0.005 - 0.02%) usually used in the fabrication of high-strength, nodular cast irons. Similar experiments were also carried out on grey and magnesium-modified cast irons. The diffusion of iron was studied at 960 - 1 200 °C. Both the radiometric and outer radiographic methods were used. Conclusions:  
1) the grain-boundary diffusion predominates in Mg-bearing iron at 900 - 1 200 °C. 2) The order of magnitude of the self-diffusion coefficient of iron is not affected by Mg additions - the same applying to diffusion of Fe in Mg-modified cast iron. 3) Mg acts as a grain-refining agent and slows down the rate of grain-growth

The effect of ....

in Fe at 960 - 1 100 °C. This is demonstrated in a figure where the grain size ( $\mu$ ) is plotted against the annealing temperature ( $^{\circ}$ C) of armco iron (top curve) and iron with 0.005, 0.14 and 0.02% Mg (lower curves, in this order); the graph has been constructed for specimens annealed for 20 hours. There are 1 figure and 1 table.
